

## SCHUNK KONTEC KSM Vise

The KONTEC KSM vise helps to increase efficiency in production and non-production applications considerably with its multiple part-clamping features where several workpieces of the same size or different sizes can be held at the same time.

This simple and quick system allows operators to significantly reduce set-up costs and increase the number of parts under the spindle. The KSM has unique vertical serration on the

inner side of the clamping rail. This keeps the serrations clean from chips and swarf and allows the jaw modules to be positioned quickly and accurately with one hand. To fix the jaws, just one screw has to be turned 180° - done. This unique concept is resistant to contamination - thus ensuring trouble-free clamping at any time. The vise jaws are based on the wedge-hook principle, provide pull-down effect and allow safe clamping of workpieces. As a result, high precision

even at high chip removal rates is guaranteed.

The clamping system consists of a corrosion resistant 65 or 90 mm wide clamping rail and is available in a variety of lengths. The vertical serration within the rail ensures workpiece support on a smooth surface. Since no chips can jam the rails, the system is protected against damage and wear and assures a high service life. The KONTEC KSM clamping device has mounting bores for easy assembly onto a grid table and vertical grooves for mounting on machine tables with T-nuts and is also a perfect complement for the SCHUNK Vero-S Quick Change Pallet system.

About SCHUNK:

SCHUNK is a family owned operation and a global player in one. Totalling more than 60 years of experience, SCHUNK is a leading worldwide manufacturer of toolholding components, workholding systems, and automation components. With a reputation for high quality products, absolute precision, and continuous innovation, SCHUNK is a reliable partner. For more information, visit [www.schunk.com](http://www.schunk.com)
